

Generalized Structural Trigger and Computational Growth Intelligence

GST-CGI | v1.0.0

From Two-Way CCC and Leaf Resolution to Delegated Unfolding and AI Computational-System Growth

Key Idea

GST-CGI extends Two-Way CCC beyond String-DNA-only triggers toward generalized structural triggers carrying structural state, comparison semantics, controlled behavior, evidence APIs, and policy perspectives. A structural leaf is then resolved through DECIDE, REFINE, LEFTOVER, or DELEGATE - allowing unresolved experience and bounded external computation to become inputs to structural and computational growth.

Canonical Structural Flow

AI Growth Ladder

1. Experience Growth

Cases, trajectories, patterns, evidence, and structural memory.

2. Performance Growth

Evaluation, selection, scoring, and policy refinement improve performance.

3. Computational-Structure Growth

AI grows nodes, branches, triggers, metrics, evidence contracts, and CallingGraph fragments.

4. Computational-System Growth

Validated relationships among specialized intelligences become reusable computational structure.

Governance Principle

"Export capability, not authority."

Core Proposition

AI can evolve from learning within a computational system toward participating in the governed growth of the computational structures and computational systems through which future intelligence is performed.
